

Are you an innovative organisation passionate about making an impact on the energy industry?

Loy Yang B is a brown coal fired power station located in Victoria's Latrobe Valley seeking ideas to materially enhance our operational performance in the areas of efficiency improvements, resource utilisation and reducing waste and emissions.

We're offering access to an operational 1100MW thermal power station and direct funding opportunities for suitable projects to help us improve our environmental footprint.

If this sounds like you, check out our research and development program by visiting www.loyyangb.com.au/research-and-development.php to read more about the initiative, review program guidelines and submit an expression of interest.
